

COMPUTER INTEGRATED TECHNOLOGIES OF PROCESS SIMULATION AND EQUIPMENT FOR THE SYNTHESIS AND PROCESSING OF HIGH MOLECULAR COMPOUNDS

Working program of the academic discipline (Syllabus)

Details of the academic discipline

Level of higher education	<i>Second (master's)</i>
Branch of knowledge	<i>13 Mechanical engineering</i>
Specialty	<i>133 Industrial engineering</i>
Educational program	<i>Engineering and computer-integrated design technologies of innovative industry equipment</i>
Discipline status	<i>Selective</i>
Form of education	<i>Daytime</i>
Year of training, semester	<i>1st year, spring semester</i>
Scope of the discipline	<i>7.5 credits</i>
Semester control/ control measures	<i>Exam</i>
Lessons schedule	<i>http://rozklad.kpi.ua/Schedules/ScheduleGroupSelection.aspx</i>
Language of teaching	<i>Ukrainian</i>
Information about head of the course / teachers	<i>Lecturer/Practical/Laboratory: associate professor of the department, candidate of technical sciences, associate professor M.P. Shved, <npchved46@gmail.com> Lecturer/Practical/Laboratory: associate professor of the department, candidate of technical sciences, associate professor A.R. Stepaniuk, <arstepaniuk@gmail.com></i>
Placement of the course	<i>https://ci.kpi.ua/uk/syllabuses-bac-disciplines/#place</i>

Program of educational discipline

The purpose of the educational discipline is to form students' competence:

- the ability to carry out calculation and design, modernization and operation along the entire life cycle of equipment, and disposal of waste from deep processing of organic raw materials.*

1.2. The main tasks of the academic discipline.

knowledge:

- modern approaches, methods and techniques, solving problems in design, maintenance, modernization and operation along the entire life cycle of equipment, and disposal of waste from deep processing of organic raw materials*

skill:

- using scientific and technical information, regulatory documents, professional knowledge, perform calculation and design, modernization and operation along the entire life cycle of equipment, and disposal of waste from deep processing of organic raw materials

1. Pre-requisites and post-requisites of the discipline (place in the structural and logical scheme of training according to the relevant educational program)

The list of disciplines, the mastery of which is necessary for the student (requirements for the level of preparation) for successful mastering of the discipline:

- Processes and equipment of chemical technologies

the list of disciplines that are based on the results of training in this discipline.:

- Pre-diploma practice
- Diploma design

2. Content of the academic discipline

Chapter 1. Theoretical foundations of polymer production processes.

Topic 1.1. Properties of polymers as high molecular weight compounds.

Information is given on the structure, main properties and raw materials for the production of polymers, the composition of plastics. Types of deformations, stress tensor and deformation rates are considered and their physical meaning is revealed. The main thermophysical properties of polymers, simple shear, Hooke's law, dissipation energy are considered. The classification of non-Newtonian fluids is given. The spherical tensor and deviator, properties of polymer melts, power equation are considered. Flow curves are processed. Rheological equations of Newtonian and non-Newtonian fluids, invariants of the strain rate tensor are considered.

Topic 1.2. Typical technological schemes of polymer synthesis.

The general characteristics of polymer synthesis processes are given. The mechanism of polymerization and polycondensation reactions is considered. The main technological schemes of polymer synthesis processes are given. The method of synthesis of polymers in mass, emulsion, suspension, solution is considered. The types of polymer materials, their main characteristics, areas of application, and labeling are given. A general classification of fusion reactors is given. Advantages and disadvantages of polymer synthesis methods (mass, solution, emulsion and suspension) are considered.

Topic 1.3. Kinetics of chemical transformations during the synthesis of polymers.

The physical content of reaction speed and conversion speed is considered. Methods of controlling the conversion rate are considered. The peculiarities of the kinetics of homogeneous transformations are considered on the example of a simple and complex (reversible) chemical reaction. The equations for determining the rate of a chemical reaction, the main factors that affect the rate of a chemical reaction, the Arrhenius equation are given. The peculiarities of the kinetics of heterogeneous transformations in liquid-liquid systems, the physical meaning of the diffusion coefficient, are considered. The peculiarities of the kinetics of heterogeneous transformations in liquid-solid systems, the physical meaning of the mass transfer coefficient are considered.

Chapter 2. Basics of modeling polymer synthesis processes

Topic 2.1. General mathematical model of synthesis processes.

The equations of conservation of mass and energy for batch reactors (capacitive type), their physical essence and partial cases are considered. The equations of conservation of mass, energy and amount of movement are considered in general form. The equation of conservation of mass and energy for continuous reactors (tubular and column types), their physical essence and partial cases are considered. The main laws of mass and energy transfer, the concept of a solid environment are considered. The physical meaning of the concept of "ideal mixing and ideal displacement reactors" is considered. The principle of formulating mathematical models of batch and continuous reactors is presented. The system of conservation equations in a general form and the principles of its solution are presented. Hydrodynamics in tank and tubular reactors are considered. The method of calculating the number of revolutions of mixing devices is given. The classification of mixing devices is given. Heat exchange processes in reactors are analyzed. Heat balance and heat transfer in reactors are considered. The conditions of stable operation of

reactors are determined. The physical content of the heat of dissipation and its influence on the course of polymer synthesis processes are considered.

Topic 2.2. Modeling of periodic devices.

The mathematical model, calculation algorithm, heat and material balances of batch reactors are considered.

Topic 2.3. Modeling of devices of continuous action.

The mathematical model, calculation algorithm, heat and material balances of continuous reactors are considered.

Chapter 3. Basic methods of polymer processing.

Topic 3.1. Classification of methods and their implementation in technological schemes.

The main properties of polymers are considered and the classification of the main methods of their processing (extrusion, injection molding, blow molding, pneumatic and vacuum forming, pressing, calendaring), as well as technological schemes of these methods are given.

Chapter 4. Extrusion processing methods.

Topic 4.1. Equipment for the preparation of melt.

The principle of operation and design features of extruders, the physical model of extrusion, the principle of calculation using the stepwise approximation method are considered.

Topic 4.2. Modeling of melt preparation processes.

Mathematical models of the processes taking place in individual zones of the extruder (feeding, melting, homogenization), algorithms for their calculation are considered. Gives the principle of building a general algorithm for calculating worm extruders, choosing the geometry of working bodies and polymer processing modes.

Topic 4.3. Processes and equipment for forming products.

The peculiarities of product formation and the design of forming heads, the generalized algorithm for their calculation, the functional connection of the extruder and the forming head, operating characteristics and operating points are considered.

Topic 4.4. Processes and equipment for heat treatment of products.

The principles of modeling heat treatment processes and design features of the equipment are considered. The algorithm for calculating heat treatment processes is considered using the example of a polymer pipe cooling scheme.

Chapter 5. Modeling of thermal processes of deep oil refining.

Topic 5.1. Modeling of thermal cracking processes.

Introduction. Modeling of thermal and thermocatalytic cracking processes is analyzed. General concepts and classification of thermal processes are taught. Raw materials and final products are analyzed. Process flow charts are analyzed.

The classification of thermal processes of oil processing, the design and principle of operation of the main types of thermal cracking installations are analyzed and presented.

Topic 5.2. Modeling of visbreaking processes. Modeling of coke production processes.

Modeling of visbreaking processes is analyzed. The purpose of the process is justified. Raw materials and the final product of processing are analyzed. An analysis of technological process schemes, structures and the principle of operation of the main types of visbreaking installations is given. Modeling of coke production processes is analyzed. The raw materials used and their characteristics are analyzed. The appointment of coke is substantiated. An analysis of technological process schemes, structures and the principle of operation of the main types of coking plants is provided.

Chapter 6. Modeling of thermocatalytic processes of oil refining

Topic 6.1. Modeling of thermocatalytic cracking processes.

Modeling of thermocatalytic cracking processes is analyzed. The main characteristics of catalysts, poisons and pollutants of catalysts are given. The process of catalytic cracking is analyzed. An analysis of the technological schemes of the process, design and principle of operation of the main types of thermocatalytic cracking installations is given.

Topic 6.2. Modeling of catalytic reforming processes.

Modeling of catalytic reforming processes is analyzed. Raw materials and their characteristics are analyzed. The necessity of cleaning raw materials is substantiated. Catalysts of the reforming process, catalyst poisons and the fight against catalyst pollution are analyzed. An analysis of technological process schemes, designs and the principle of operation of the main types of reforming installations is provided.

Topic 6.3. Modeling of processes of hydrotreatment of distillation fractions. Modeling of hydrocracking processes.

Modeling of processes of hydrotreatment of distillation fractions is analyzed. The physical and chemical foundations of the hydrotreatment process are given. An analysis of typical technological process schemes is provided. Catalysts, raw materials, products and hardware design of the technological scheme are analyzed. Modeling of hydrocracking processes is analyzed. Physico-chemical bases of the hydrocracking process are presented. An analysis of typical technological process schemes is provided. Catalysts, raw materials, products and hardware design of the technological scheme are analyzed.

Chapter 7. Modeling of petroleum gas processing processes.

Topic 7.1. Modeling of gas fractionation processes.

Modeling of gas fractionation processes is analyzed. The physical and chemical principles of the gas fractionation process are given. An analysis of typical technological process schemes is provided. Raw materials, products and hardware design of the technological scheme are analyzed.

Topic 7.2. Modeling of alkylation processes of petroleum gases. Modeling of processes of polymerization and modification of hydrocarbon gases.

The simulation of the alkylation processes of petroleum gases is analyzed. The physical and chemical principles of the sulfuric acid alkylation process are given. An analysis of typical technological process schemes is provided. Raw materials and products are analyzed. The physicochemical principles of the hydrogen fluoride alkylation process are given. Typical technological schemes are given. Raw materials, products and hardware design of the technological scheme are analyzed. Modeling of the processes of polymerization and modification of hydrocarbon gases is analyzed. The physicochemical principles of the polymerization process are given. An analysis of typical technological process schemes is provided. Raw materials and products are analyzed. Physico-chemical principles of the process of isomerization of paraffin hydrocarbons are given. Typical technological schemes are given. Raw materials, products and hardware design of the technological scheme are analyzed.

Chapter 8. Modeling of liquid fuel cleaning processes.

Topic 8.1. Modeling of processes of furfural purification of gas oils.

Modeling of processes of furfural purification of gas oils is analyzed. Physico-chemical principles of the process of furfural purification of gas oils are given. An analysis of typical technological process schemes is provided. Raw materials, products and hardware design of the technological scheme are analyzed.

Topic 8.2. Modeling of catalytic demarcaptalization processes.

Modeling of catalytic demarcaptalization processes is analyzed. The physical and chemical principles of the catalytic demarcaptalization process are given. An analysis of typical technological process schemes is provided. Raw materials, products and hardware design of the technological scheme are analyzed.

their columns The method of sizing the elements of the fractionating rectification column is given.

3. Educational materials and resources

3.1 Basic

1. *Synopsis of lectures. Access from the screen: <http://login.kpi.ua>.*
2. *Radchenko L.B. Processing of thermoplastics by the extrusion method: Science. manual. - K.: IZMN, 1999. - 220c.*
3. *Radchenko L.B. Sivetsky V.I. Basics of modeling and designing worm extruders: Science. manual. - K.: Polytechnic, 2002. - 152c.*
4. *Piven O.N., Grechana N.A., Chornobylskyi I.I. Thermophysical properties of polymeric materials. Directory. - K.: Higher School, 1975. - 317 p.*
5. *Thermophysical and rheological characteristics and friction coefficients of filled thermoplastics. Handbook / Under the editorship of Yu.S. Lipatova - K.: Science. dumka, 1977. - 244 p.*

6. Study of rheological properties of polymer solutions. Methodical instructions for the performance of laboratory work by students of the specialty: 133 Industrial mechanical engineering, specialization: Engineering, equipment and technologies of chemical and oil refining industries, educational and qualification level specialist in the discipline "Equipment for the synthesis and processing of polymeric materials": [Electronic resource] / "KPI im. . Igor Sikorsky"; structure. M. P. Shved, A. R. Stepaniuk. - Kyiv: "KPI named after Igor Sikorsky", 2017. 17p. Access from the screen: <http://si.kpi.ua>.
7. Research of the line for the production of sleeve polymer film. Methodical instructions for laboratory work / Radchenko L.B., Ruzhynska L.I., Shved M.P., Stepaniuk A.R. - K.: NTUU "KPI", 1998. - 44 p.

3.2. Auxiliary

1. Trokhin Y.Y., Bebko V.V. Processes and equipment for the production of polymeric materials. - K.: KPI, 1985. - 11 p.

Educational content

4. Methods of mastering an educational discipline (educational component)

Lecture classes

Lectures are aimed at:

- provision of modern, comprehensive in-depth knowledge of the discipline, the level of which is determined by the target attitude to each specific topic;
- provision of critical creative work together with the teacher in the process of work;
- education of acquirers of professional qualities and development of their independent creative thinking;
- awareness of global trends in the development of science in the field of processes and technology of primary gas and oil processing;
- awareness of the methods of processing information resources and determining the main directions for solving specific scientific and technical problems;
- teaching research materials in a clear and high-quality language, observing structural and logical connections, explaining all the given terms and concepts available for perception by the audience.

No s/p	The name of the topic of the lecture and a list of the main questions (a list of didactic tools, references to the literature and tasks on the SRS)	Num ber hour s
	Chapter 1. Theoretical foundations of polymer production processes.	
	Topic 1.1. Properties of polymers as high molecular weight compounds.	
1-1	Structure, main properties and raw materials for the production of polymers. Composition of plastics. Types of deformations. Literature: 1-5. Task on SRS: Thermophysical properties of polymers. A simple shift. Hooke's law. Energy dissipation.	1
1-2	Properties of polymer melts. Classification of non-Newtonian fluids. Power equation. Processing of current curves. Literature: 3-8, 18. Tasks on SRS: Types of polymer materials and their labeling. Main characteristics and areas of application.	1
	Topic 1.2. Typical technological schemes of polymer synthesis.	
	Topic 1.3. Kinetics of chemical transformations during the synthesis of polymers.	
2-1	General characteristics of polymer synthesis processes. Polymerization and polycondensation reactions, mechanism of flow. Examples of technological schemes of synthesis processes. Bulk synthesis of polymers. Literature: 1, 2, 11-14.	1

	<i>Task on SRS: General classification of fusion reactors. Reaction speed and conversion speed. Controlling the conversion rate.</i>	
2-2	<i>Examples of technological schemes of synthesis processes. Synthesis of polymers in solution. Literature: 1, 2, 11-14. Task on SRS: Kinetics of homogeneous transformations. Simple and complex (reversible) chemical reactions.</i>	1
3-1	<i>Examples of technological schemes of synthesis processes. Synthesis of polymers in emulsion and suspension. Advantages and disadvantages of polymer synthesis methods (in mass, solution, emulsion and suspension). Literature: 1, 2, 11-14. Task on SRS: Kinetics of heterogeneous transformations in liquid-liquid, liquid-solid systems.</i>	1
Chapter 2. Basics of modeling polymer synthesis processes		
Topic 2.1. General mathematical model of synthesis processes.		
3-2	<i>Basic laws of mass and energy transfer. The concept of a continuous environment. Mass and energy conservation equation for batch reactors (capacitive type). Physical essence and partial cases. Literature: 7, 8. Task on SRS: Equation of conservation of mass and energy for reactors of continuous action (tubular and column types). Physical essence and partial cases.</i>	1
4-1	<i>Hydrodynamics in tank and tubular reactors. Types of mixing devices. Calculation of the number of revolutions of mixing devices. Literature: 14. Tasks on SRS: Reactors of ideal mixing and ideal displacement. Formulation of mathematical models of batch and continuous reactors. Literature: 7-13.</i>	1
4-2	<i>Heat exchange in reactors. Heat balance, heat transfer. Literature: 15. Tasks at SRS: Conditions for stable operation of reactors.</i>	1
Topic 2.2. Modeling of periodic devices.		
5-1	<i>Mathematical model of the batch reactor of the capacitive type. Literature: 11, 16, 17. Task on SRS: Algorithm for calculation of a reactor of periodic action of the capacitive type.</i>	1
Topic 2.3. Modeling of devices of continuous action.		
5-2	<i>Mathematical model of a continuous reactor. Literature: 11, 16, 17. Task on SRS: Algorithm for calculating a continuous reactor.</i>	1
Chapter 3. Basic methods of polymer processing		
Topic 3.1. Classification of methods and their implementation in technological schemes		
6-1	<i>Properties of polymers. Classification of the main methods of processing them into products (extrusion, injection molding, blow molding, pneumatic and vacuum molding, pressing, calendaring). Literature: 1, 5, 6. Tasks on SRS: Technological diagrams illustrating the main methods of processing (extrusion, injection molding, blow molding, pneumatic and vacuum forming, pressing, calendaring), and equipment for their implementation. Literature: 2-10.</i>	1
Chapter 4. Extrusion methods of polymer processing		
Topic 4.1. Equipment for the preparation of melt		

7-1	<p>Characteristics of melt preparation equipment. Extruders. Principle of action, classification, design features.</p> <p>Literature: 5-10.</p> <p>Tasks on SRS: Design features of extruders.</p> <p>Literature: 5-10.</p>	1

Practical training

Applicants should be helped to develop creative thinking, a creative approach to the scientific substantiation of the research direction and methodology. The main tasks of the cycle of practical classes:

- to help applicants deepen their theoretical knowledge in the field of processes and technology of primary gas and oil refining;
- to promote the training of miners in the methodology of determining the properties of oils and the peculiarities of their processing;
- form criteria for evaluating the efficiency of primary gas and oil refining processes.

No s/p	The name of the subject of the practical session and a list of the main questions (list of didactic support, references to the literature and tasks on the SRS)	Number hours
Chapter 1. Theoretical foundations of polymer production processes		
Topic 1.1. Properties of polymers as high molecular weight compounds.		
1-2	Study of thermophysical and rheological properties of polymer melts. Literature: 3-8, 18-24.	4
3	Study of the fluidity index of the polymer melt. Literature: 11, 16, 17.	2
4-5	Study of thermophysical and rheological properties of polymer melts. Literature: 3-8, 18-24.	4
Chapter 4. Extrusion methods of polymer processing		
Topic 4.2. Modeling of melt preparation processes		
6-8	Laboratory work 4. Study of the process and equipment in the manufacture of polymer pipes by the extrusion method. Literature: 5-8.	6
Chapter 6. Thermocatalytic processes of oil refining		
Topic 6.1. Thermocatalytic cracking processes.		
9	Modeling of processes in a thermocatalytic cracking reactor. Thermal and material balance. Literature 14-17.	2
SRS: prepare Topic 11.1. Thermocatalytic cracking processes. Literature 14-17		
10	Modeling of processes in the thermocatalytic cracking regenerator. Determination of the geometric dimensions of the reactor and cyclones. Literature 14-17.	2
SRS: prepare Topic 5.1. Thermocatalytic cracking processes. Literature 1-5		
Chapter 6. Petroleum gas processing processes.		
Topic 6.1. Gas fractionation processes		
11	Modeling of processes in a fractionating column. Heat and material balances. Determination of the parameters of the strengthening and driving part Literature 14-17.	2

	<i>SRS: prepare Topic 8.1. Bitumen production processes</i>	
	<i>Literature 14-17</i>	

5. Independent work of student

Independent work makes up 50% of the study of the credit module, which includes preparation for the credit. The main task of independent work acquirers- this is the deepening of worldview and scientific knowledge in the directions specified in the lectures, by searching for the necessary information, forming perseverance and creative search in the formation of working hypotheses.

5	<i>Kinetics of heterogeneous transformations in liquid-liquid, liquid-solid systems. Literature:</i>	4
	Chapter 2. Basics of modeling polymer synthesis processes	
	Topic 2.1. General mathematical model of synthesis processes.	
6	<i>Equation of conservation of mass and energy for continuous reactors (tubular and column types). Physical essence and partial cases. Literature:</i>	4
7	<i>Ideal mixing and ideal displacement reactors. Formulation of mathematical models of batch and continuous reactors. Literature: 7-13.</i>	4
8	<i>Conditions of stable operation of reactors. Literature:</i>	4
	Topic 2.2. Modeling of periodic devices.	
9	<i>Algorithm of calculation of the reactor of periodic action of the capacitive type. Literature:</i>	4
	Topic 2.3. Modeling of devices of continuous action.	
10	<i>Algorithm for the calculation of a continuous reactor. Literature:</i>	4
	Chapter 3. Basic methods of polymer processing	
	Topic 3.1. Classification of methods and their implementation in technological schemes	
11	<i>Technological schemes illustrating the main methods of processing (extrusion, injection molding, blow molding, pneumatic and vacuum forming, pressing, calendaring), and equipment for their implementation. Literature: 2-10.</i>	4
	Chapter 4. Extrusion methods of polymer processing	
	Topic 4.1. Equipment for the preparation of melt	
12	<i>Design features of extruders. Literature: 5-10.</i>	4
13	<i>A generalized algorithm for calculating extruders. Literature: 5-10.</i>	4
	Topic 4.2. Modeling of melt preparation processes	
14	<i>Algorithm for calculating the feeding process in the worm channel. Literature: 5-6.</i>	5
15	<i>The algorithm for calculating the melting process in the worm channel. Literature: 5-6.</i>	5
16	<i>Algorithm for calculating the homogenization process. Algorithm for the design calculation of a worm extruder. Literature: 5-6.</i>	5
	Topic 4.3. Processes and equipment for forming products	
17	<i>A generalized algorithm for calculating forming heads. Literature: 2-10.</i>	5
18	<i>Optimization of the geometry of the working bodies of extruders.</i>	5

	<i>Literature: 2-10.</i>	
	Chapter 5. Thermal processes of deep oil refining	
	Topic 5.1. Thermal cracking processes.	
19	<i>Tasks at the SRS: Designs and the principle of operation of the main types of apparatus for thermal cracking processes.</i>	7
	<i>literature[14-17].</i>	
	Topic 5.2. Coke production processes.	
20	<i>Tasks at SRS: Designs and the principle of operation of the main types of coking process apparatus.</i>	7
	<i>literature[14-17].</i>	
	Chapter 6. Thermocatalytic processes of oil refining	
	Topic 6.1. Thermocatalytic cracking processes.	
21	<i>Tasks at SRS: Designs and principle of operation of the main types of devices for thermocatalytic cracking processes.</i>	7
	<i>literature[14-17].</i>	
	Topic 6.2. Catalytic reforming processes	
	<i>Tasks at the SRS: Designs and principle of operation of the main devices for reforming processes</i>	7
	Topic 6.3. Hydrotreating processes of distillation fractions. Hydrocracking processes.	
22	<i>Tasks at SRS: Designs and the principle of operation of the main devices for the processes of hydrotreating AND hydrocracking</i>	7
	Chapter 7. Oil gas processing processes.	
	Topic 7.1. Gas fractionation processes	
23	<i>Tasks at the SRS: Designs and the principle of operation of the main devices for gas fractionation processes of saturated hydrocarbons</i>	7
	Topic 7.2. Processes of alkylation of petroleum gases.	
24	<i>Tasks at the SRS: Designs and the principle of operation of the main devices for gas fractionation processes of unsaturated hydrocarbons and processes of polymerization and modification of hydrocarbon gases</i>	7
	<i>literature[14-17]</i>	
	Chapter 8. Liquid fuel purification processes.	
	Topic 8.1. Processes of furfural purification of gas oils.	
25	<i>Tasks at the SRS: Designs and principle of operation of the main devices for the processes of furfural purification of gas oils</i>	7
	<i>literature[14-17]</i>	
	Chapter 9. Oil production processes.	
	Topic 9.1. Processes of olive production	
26	<i>Tasks at SRS: Designs and principle of operation of the main devices for oil production processes</i>	7
	<i>literature[14-17]</i>	
	Chapter 10. Production of naphtha bitumen.	
	Topic 10.1. Production of naphtha bitumen.	
27	<i>Tasks at the SRS: Designs and the principle of operation of the main devices for the production of naphtha bitumen</i>	3
	<i>literature[14-17]</i>	
28	<i>Modular control work</i>	10
	<i>Tasks on SRS: Repeat chapters 5-10</i>	
	<i>literature[14-17]</i>	

6. Policy of academic discipline (educational component)

Rules of attending classes and behavior in classes

Attending classes is mandatory. Getters are obliged to take an active part in the educational process, not to be late for classes and not miss them without valid reasons, not to interfere with the teacher conducting classes and not to be distracted by actions not related to the educational process.

Rules for assigning incentive and penalty points

- incentive points can be awarded by the teacher exclusively for the performance of creative works and working hypotheses.
But their sum cannot exceed 25% of the rating scale.
- Penalty points are not provided within the academic discipline.

Policy of deadlines and rescheduling

In case of academic debts arising from the academic discipline or any force majeure circumstances, acquirers should contact the teacher to coordinate the algorithm of actions related to solving existing problems.

Policy of academic integrity

Plagiarism and other forms of dishonest work are unacceptable. Plagiarism refers to the absence of references when using printed and electronic materials, quotes, opinions of other authors. Inadmissible tips and write-offs during writing tests, conducting classes.

The policy and principles of academic integrity are defined in Chapter 3 of the Code of Honor of the National Technical University of Ukraine "Ihor Sikorsky Kyiv Polytechnic Institute". More details: <https://kpi.ua/code>

Policy of academic behavior and ethics

Getters must be tolerant, respect the opinion of others, formulate objections in the correct form, adequately support feedback during classes.

Standards of ethical behavior of students and employees are defined in Chapter 2 of the Code of Honor of the National Technical University of Ukraine "Ihor Sikorsky Kyiv Polytechnic Institute". More details: <https://kpi.ua/code>

7. Types of control and rating system for evaluating learning outcomes (RSO)

Distribution of study time by types of classes and tasks in the discipline according to the working study plan:

Semester	Training time		Distribution of study hours				Control measures		
	Credits	Acad. hours	Lectures	Practical	Lab. do	SRS	MKR	RR	Semester control
2	7.5	225	36	36	–	136	--	–	exam

The student's rating in the discipline consists of the points he receives for:

The rating of the applicant from the credit module consists of the points he receives for work in practical classes, lectures and MKR.

Semester control is an exam.

System of rating (weighted) points and evaluation criteria

A weighted point for questions in lectures is 1 point

The weighted score for practical classes is 2 points each;

Weighted score for the exam is 25 points

Criteria for evaluating the performance of a practical task

Completeness and signs of task completion	Points
The task is fully completed	2
Minor defects according to point 1	1.5
Untimely completion of the task	1.0
Untimely completion of the task, deficiencies under clause 1	1.0
Poor performance of the task	1.0
Failure to complete the task	0

Thus, the rating semester scale for the credit module is:

$$R = 34 \cdot 1 + 2 \cdot 13 + 1 \cdot 28 = 34 + 36 + 25 = 100 \text{ points}$$

According to the results of the educational work in the first 7 weeks, the "ideal acquirer" should score 40 points. At the first attestation (8th week), the applicant receives "credited" if his current rating is at least 20 points.

According to the results of the educational work for 13 weeks of training, the "ideal achiever" should score 90 points. At the second attestation (14th week), the applicant receives "credited" if his current rating is at least 40 points.

The maximum number of points is 100. To receive credit from the credit module "automatically" you need to have a rating of at least 60 points.

A necessary condition for admission to credit is a rating of at least 40% of the rating scale (R), i.e. 40 points.

Getters, who gained a rating of less than 0.6 R during the semester, as well as those who want to improve the overall rating, complete a credit test. At the same time, all the points they received during the semester are cancelled. Test tasks contain questions that refer to different sections of the credit module. The list of assessment questions is given in Chapter 9.

To obtain a passing grade, the sum of all rating points R received during the semester is converted according to the table:

Scores	Rating
95...100	perfectly
85...94	very good
75...84	fine
65...74	satisfactorily
60...64	enough
RD < 60	unsatisfactorily
Admission conditions not met	not allowed

8. Additional information on the discipline (educational component)

An approximate list of questions submitted for semester control

The ticket consists of three questions

Part 1

- Justify the purpose of worm machines.
- What are the main working organs of a worm extruder?
- Give the types of classification of high molecular weight substances.

- Give the classification of high molecular weight substances according to the origin of high molecular weight compounds (MHC).
- Give the classification of high molecular weight substances according to the nature of the Navy. are divided into:
- Give the classification of high-molecular substances according to the type of reaction of obtaining IMS
- Give the classification of high molecular weight substances in relation to the action of elevated temperatures of the Navy.
- Give the classification of high molecular weight substances depending on the composition of the main (main) chain of the Navy
- Analyze the structure of polymer macromolecules
- Analyze the concepts of thermoplastics and thermoplastics.
- Analyze the concept of mechanical hysteresis.
- Analyze the concept of polyolefins and their properties.
- Analyze the concepts of polystyrene and its copolymers and their properties.
- Analyze the concept of polyvinyl chloride and its copolymers and their properties.
- Analyze the concept of polyvinyl acetate plastics and their properties.
- Analyze the concept of polymethyl methacrylate and their properties.
- Analyze the concept of polyamides and their properties.
- Analyze the concept of polyethylene terephthalate and their properties.
- Analyze the concept of fillers and composite materials based on polymers and their properties.
- Analyze the concept of polyolefins and their properties.
- Analyze the concept of polyolefins and their properties.
- Analyze the concept of polyolefins and their properties.
- Analyze the stages of chemical and technological processes.
- To analyze the following most used features of the classification of chemical reactors.
- Analyze the concept of hydrodynamic conditions in the reactor.
- Analyze the concept of heat exchange conditions in the reactor,
- Analyze the concept of the phase composition of the reaction mixture in the reactor.
- To analyze the concept of the method of organization of the process in the reactor.
- Analyze the concept of the nature of changes in process parameters over time in the reactor.
- Analyze the concept of structural characteristics of reactors.
- To analyze the technological process parameters in a batch reactor.
- Analyze the parameters of the technological process in a continuous reactor.
- To analyze the design features of a capacitative reactor.
- Analyze the design features of a column reactor.
- Analyze the design features of a tubular reactor.
- Analyze the basics of the theory of chemical reactors. reactors for homogeneous processes
- To analyze the mathematical model of the ideal mixing batch reactor
- To analyze the mathematical model of the ideal displacement reactor of continuous operation
- To analyze the mathematical model of the ideal mixing reactor of continuous action
- Analyze methods of manufacturing plastic products.
- Analyze the classification of methods of manufacturing plastic products.
- To analyze the physical and chemical bases of plastic processing
- Analyze concepts fluidity and its use during polymer processing
- Analyze the areas of use of the melt flow index.
- Analyze the concept of rheological properties of polymer melts
- Analyze the determination of the viscosity of polymer melts on a capillary viscometer
- To analyze the operation of viscometers with coaxial cylinders ("cylinder-cylinder") and "cone-plane" type.

- *Analyze the principle of operation and structural schemes of extruders.*
- *Analyze the use of worm extruders.*
- *To analyze the principle of action and the design scheme of a single-worm extruder of single-worm extruders.*
- *Analyze the scheme of the melting process of polymer material in a standard screw.*
- *Analyze the designs of screws with one-way threading.*
- *To justify the use of dispersive mixing elements.*
- *To analyze the principle of operation and structural schemes of multistage extruders.*
- *To analyze the principle of operation and the need to use gear pumps in cascade disk-gear extrusion.*
- *Analyze the principle of action and the general structure and principle of action of a worm extruder.*
- *Analyze the principles of modeling extruders.*

Part 2

- *Oil gas processing*
- *Gas fractionation*
- *Types of gas fractionation installation*
- *Raw material of the gas fractionation plant.*
- *Products of the gas fractionation installation.*
- *Fractions released at gas fractionation plants that work with saturated gases.*
- *Fractions obtained at gas fractionation plants of unsaturated hydrocarbons.*
- *Cost indicators of the gas fractionation installation.*
- *Technological scheme of processing of saturated hydrocarbons*
- *Condensing-compressor type installation*
- *Standardization of gas fractions according to technical conditions*
- *Technological scheme of processing of unsaturated hydrocarbons*
- *Absorption-rectification type gas fractionation plant*
- *Technological scheme of gas fractionation installations at various refineries*
- *Allocation of costs for gas fractionation*
- *Power of gas fractionation installations.*
- *Material balance of the gas fractionation installation*
- *Cost indicators for 1 ton of raw material*
- *Sulfuric acid alkylation*
- *Reactions taking place during sulfuric acid alkylation*
- *Hydrocarbon groups formed as a result of the sulfuric acid alkylation reaction*
- *Sulfuric acid alkylation raw material*
- *Products of sulfuric acid alkylation*
- *Sulfuric acid alkylation catalyst*
- *Installation of sulfuric acid alkylation*
- *Material balance of sulfuric acid alkylation plants*
- *Composition of raw materials for sulfuric acid alkylation*
- *Consumption figures for 1 ton of alkyl gasoline*
- *Steam hydrogen alkylation.*
- *Composition of olefinic raw materials*
- *Hydrogen fluoride alkylation*
- *Raw materials for hydrogen fluoride alkylation*
- *Products of hydrogen fluoride alkylation*
- *Hydrogen fluoride alkylation catalyst*
- *Installation of fluoro-hydrogen alkylation*
- *Polymerization*

- *Production of polymerization plants*
- *Disadvantages of polymer gasoline*
- *Catalysts of polymerization units*
- *BBF polymerization installation*
- *Cracking on a phosphoric acid catalyst*
- *Raw materials for polymerization plants*
- *Reaction products of polymerization units*
- *Selective polymerization of isobutylene*
- *Installation of SELECTOPOL*
- *The raw material of the SELEKTOPOL installation*
- *Modifications of the SELEKTOPOL installation*
- *Oligomerization of isobutylene*
- *Installation of oligomerization of isobutylene*
- *Demirization*
- *Raw materials, products of the demirization installation*
- *Installation of DIMERSOL*
- *Isomerization of paraffin hydrocarbons*
- *Types of isomerization reactions of paraffinic hydrocarbons*
- *Isomerization catalysts of paraffinic hydrocarbons*
- *Isomerization of butane*
- *Isomerization of the pentahexane fraction*
- *Installation TYPE.*
- *2. Installation of isomerization of the pentane fraction*
- *In the production of lubricants.*
- *Lubricant production technology*
- *Cleaning of raw materials for production of lubricants*
- *Cleaning of lubricants*
- *Isomerization catalysts of paraffinic hydrocarbons*
- *Isomerization of butane*
- *Isomerization of the pentahexane fraction*

Working program of the academic discipline (syllabus):

*Compiled by Associate Professor of the Department of the Moscow State University, Candidate of Technical Sciences, Associate Professor Andrii Stepaniuk
 associate professor of the Department of the National Academy of Sciences, candidate of technical sciences, associate professor Mykola Shved*

Approved by the Department of the Academy of Medical Sciences (protocol No. 19 dated May 17, 2023)

Agreed by the Methodical Commission of the faculty (protocol No. 10 dated 05/26/2023)
